Performance of production and trade of camel products in some Middle East countries

Anousheh Khomeini Khatami

Livestock Production Management, Animal Sciences Research Institute of Iran, P.O.Box: 31585-1483, Karaj, Iran. E-mail: khatami.khomeini@gmail.com.

Accepted 17 February, 2016

There are approximately 25 million camels in the world where the global market for camel products has a potential of US\$10 billion a year based on Food and Agriculture Organization (FAO) of United Nations. The comparative advantages of the camel as a dairy animal over the other species in the same environment are difficult to quantify; however in absolute terms, it is widely recognized that the camel produces more milk for a longer period of time than any other animal under the same condition. Camel meat and milk are utilized in some Arabic and African countries and also Iranian people, in marginal of desert, use the camel meat. At present, there are about 148000 camels in Iran that mainly are dromedary (one humped camel). This number can potentially increase by 600000. Camel raising must not only be socially acceptable, but also economically viable, so management of camel farming must be taken into consideration to increase the farmer income. This study aimed to clarify the performance of production as well as trade of camel population and products in some Middle East countries. Data were collected by FAO statistics (FAO, 2011) which is available online through this organization's formal website for the period of 2000 to 2010. As a result, there has been a growing tendency to meet demand, particularly for milk, through imports. Thus, understanding the inter-relationships and conflicts between objectives and policies is a critical step towards designing and implementing more effective incentive systems. It was concluded that the meat and dairy production system of camel in the Middle East countries, especially Iran, regrettably received little attention because of unknown profit abilities of this animal.

Key words: Camel, production, trade, Middle East countries.

INTRODUCTION

Camels (*Camelus dromedarius* and *Camelus bactrianus*) are living in dry lands where there is little food and water available. Camel is used for meat, milk, fiber (wool and hair), for transport. Camel is a large ruminant native to the desert regions, able to survive without water for several days, and on a small amount of food which may be quantitatively and qualitatively inappropriate for other kinds of ruminants (Raji, 2009).

Economical capabilities of camel's products, including meat in providing a part of protein needs of urban and rural societies; providing a part of raw materials of textile industry including skin and fibers; and also providing a part of work force in agriculture will provide enough motivation for researchers in developing countries who think about alternative agriculture or stable agriculture, and will justify the execution of research projects in the field of physiology and productivity of this animal and also

other things related to this animal (Salehi and Birjandi, 2009). One of the valuable products of this animal is its milk. It is notable that camel milk rather than cow and buffalo milk has less sensitiveness and decays late, for this reason, preservation in 30°C is possible. Average percentage of camel milk compounds is: 86.9% for water, 3.9% for fat, 12.12% for dry matter, 3.5% for protein, 0.66% for ash, 0.32% for calcium and 5.6 mg for vitamin C, 70kcal for energy (in 100g) (Rahanjam and kor, 2009).

METHODOLOGY

Three main trends are observed in the camelid world:

(i) Intensification of the camel production: Camel production is intensified with the development of modern dairy farms, high dairy potential lactating camels (as the

Al-Majahim breed from Saudi Arabia) and industrial milk processing (pasteurized milk, cheese making modern packaging), or camel feed-lot with intensification of the reproduction process.

(ii) Diversification of the camel production: Camel production is diversified with increasing wider usage of camelids in agriculture activities, carting, leisure (mainly for small camelids), increasing demand of camel milk and meat for dietetic and medicinal purposes.

(iii) Increasing of the distribution area: Increasing of the distribution area in the world is linked to the climatic changes (Faye et al. 2008), diversification of their use, aridification of many parts of the world, and to the increasing demand of the camel products in urban areas.

This study aimed to clarify the performance of production as well as trade of camel population and products in some Middle East countries. Data were collected by FAO statistics (FAO, 2011) which is available online through this organization's formal website for the period of 2000 to 2010.

RESULTS AND DISCUSSION

There are approximately 25 million camels in the world

and the global market for camel products has a potential of US\$10 billion a year based of Food and Agriculture Organization of United Nations (FAO, 2011). Most of the world's camels are located in the tropics and there are significant numbers in sub-Saharan African countries such as Somalia, Ethiopia, Kenya, Sudan and Djibouti. The Arabian camel (dromedary) has one-hump and is generally found in areas with relatively warm winters and hot summers such as Pakistan, India, North Africa, Middle East (ME) and some parts of Australia and Russia. The two-humped Bactrian camel is found in areas subject to intense cold such as Russia, Iran and Mongolia and is believed to be indigenous to Mongolia. This species is raised all over Mongolia (Avery Press, 1995). Although there are many similarities in the livestock production systems of ME countries, there are also important variations. Such variations reflect differences in climate, availability of grazing land and incidence of diseases (Mirzaei and Heidelberg, 2006). Trend of population, production and trade of camels (live and primary products) in the selected countries and the world are shown in Tables 1 to 12 respectively.

Iran has been ranked 8th in terms of camel population in Asia and 20th in the world. The diversity of production

and trade in meat and milk in the selected countries is illustrated by the data presented in various dataset of this survey respectively. There is significant global trade in live camels (Foster et al., 2005), while it is hard to obtain accurate information. Table 1 shows that since 2000, global

trade in live camels has oscillated considerably. Some key exporting nations recorded by FAOSTAT between 2000 and 2005 were Qatar, United Arab Emirates (UAE), Oman and Saudi Arabia which are shown in Tables 7 and 8. According to FAOSTAT, the camel milk

production in Asia, Africa and the world were 171620, 183612, 189981 for year 2000, 1335887, 1428907, 2175272 for year 2005, and 1507507, 1612596, 2365323 (tonnes) for 2010 respectively. This trend indicates that a significant enhancement of camel milk production needs to

be considered by policy makers to plan a national roadmap prolifically.

Conclusion

Camels represent 12% domestic herbivorous biomass in African arid countries and 2% in Asia. Despite of the significant camel population, its economic role in Iran has been extensively ignored because of unknown profit abilities of this animal. Camel breeding in Iran is common in a wide part of Central and South-East of Iran where rainfall is around 100 mm/year. The comparative advantage of the camel as a dairy animal over the other species in the same environment is difficult to quantify; however in absolute terms, it is widely recognized that the camel produces more milk for a longer period of time than any other milk animal held under the same condition (Farah, 1996).

In many countries in the Middle East, Asia, and Africa, camels (Arabian and Bactrian) have been commercially exploited for hundreds of years. However, this utilization has been based on farming camels. Although the output, consumption and trade trends presented above need to be interpreted with caution, the underlying message is clear. Production of meat and milk in the study countries over the last 15 years has risen only slightly or has declined. The gap between production and consumption, which was very narrow at the beginning of the period, has widened significantly because of unknown profit abilities of this animal. As a result, there has been a growing tendency to meet demand, particularly for milk, through imports. Thus, understanding the inter-relationships and conflicts between objectives and policies is a critical step towards designing and implementing more effective

incentive systems. It was concluded that the production of camel meat and milk in the Middle East countries especially Iran regrettably received little attention.
